

# Pathfinder Lab

Spring 2026

# What Is Autonomous Sensing?

Autonomous sensing is when a robot collects information about its environment without human guidance, interprets it, and uses it to make decisions.

Robots must answer:

- Where am I?
- What is around me?
- Is there free space or an obstacle?
- What should I do next?

Real robots do this using:

- Cameras
- LIDAR
- Ultrasonic rangefinders

Your robot will do it using active ultrasonic sensing.

# Passive vs. Active Sensing

Passive sensing: robot observes the world as it is.

- Examples: camera, microphone, ambient light sensor.
- Pros: rich data
- Cons: complex processing, dependent on lighting/environment.

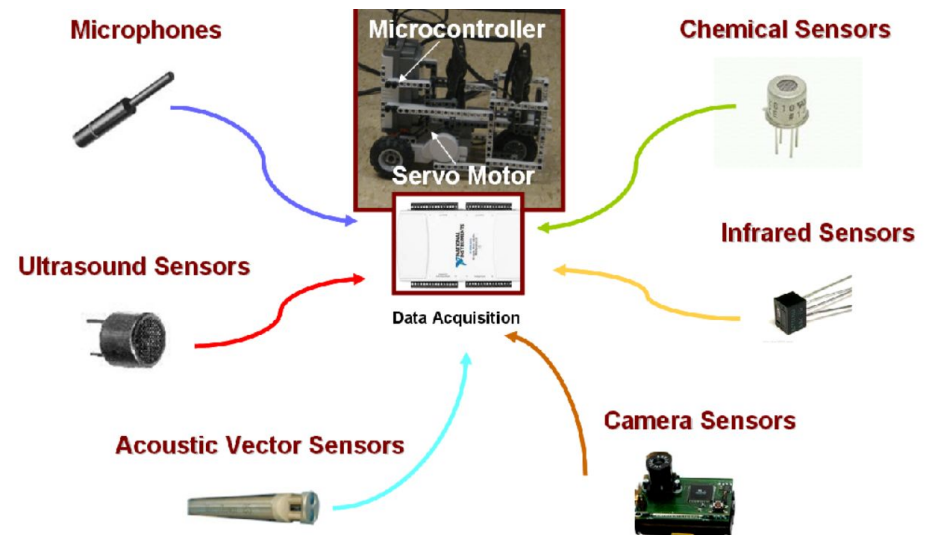

Active sensing: robot sends out energy and measures its reflection.

Examples:

- LIDAR (laser pulses)
- Radar
- Sonar / ultrasonic sensors
- Structured light

Pros: robust, simple

Cons: limited resolution

# Why Active Sensing?

- Cheap and easy to mount
- Works on reflective + non-reflective objects
- Only needs basic math
- Easy to visualize
- Similar in principle to LiDAR

# From Sensing to Perception

Raw sensor data is not enough.

Robots must convert readings into useful structure:

1. Raw distances (“30 cm at 15°”)
2. Cartesian points (“Obstacle at x=29 cm, y=7 cm”)
3. Occupancy grid (“Cell (3,0) is occupied”)
4. World interpretation (“Left corridor has an obstacle halfway down”)

■  $p_{z_{k+1}}(O_{k+1}|z_{k+1}) = 0.95$

□  $p_{z_{k+1}}(O_{k+1}|z_{k+1}) = 0.05$

■  $p_{z_{k+1}}(O_{k+1}|z_{k+1}) = 0.5$

# What Is an Occupancy Grid?

An occupancy grid is a simple 2D map where space is divided into square cells:

- 0 = free
- 1 = occupied
- ? = unknown

This idea was introduced in the 1980s and is still used today in:

- Self-driving cars
- Drone mapping
- Warehouse robots
- Search & rescue robots
- SLAM systems

In this project, your grid is small (about  $12 \times 8$  cells), but the concept is identical to what real robots use.

# How Robots Choose Actions

Once a robot has perceived its surroundings, it must decide what to do next. This is called planning.

Levels of planning:

1. Reactive control
  - a. “If something is close, slow down.”
2. Local planning
  - a. “Go left or right around this obstacle.”
3. Global planning
  - a. “Find the shortest path through a map.”

In this project, you’ll focus on local planning:

Decide which corridor (left or right) provides a clearer, safer path.

# The Perception–Planning–Action Loop

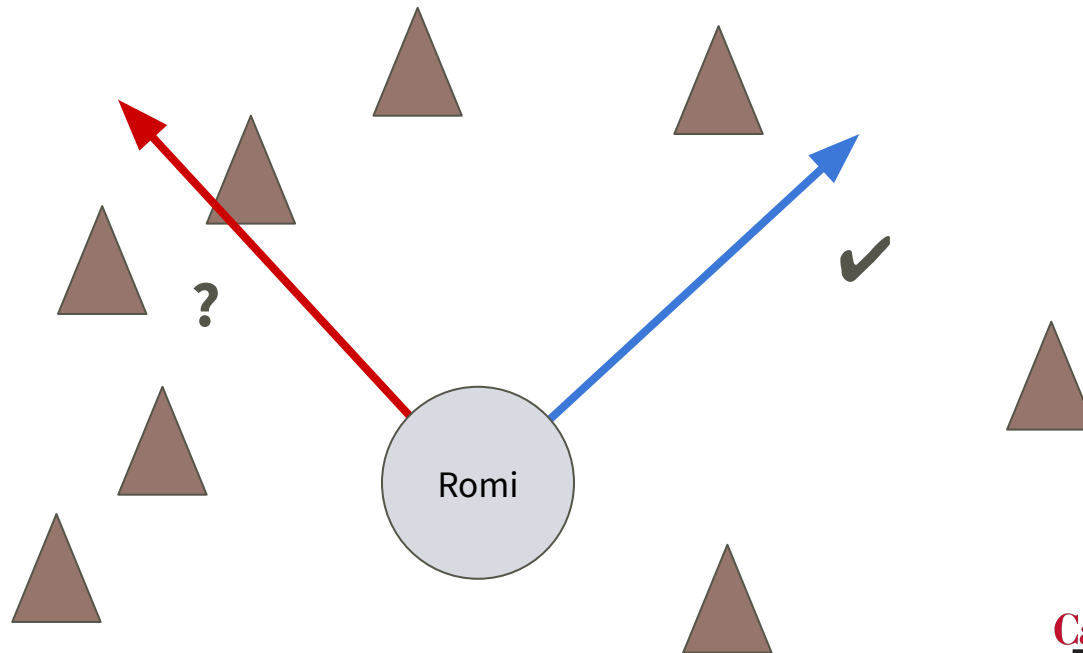

Real autonomous robots repeat this cycle: Sense → Map → Plan → Act → (repeat)

In your project, the loop looks like:

- Sense
  - Sweep the ultrasonic sensor
- Map
  - Convert distances to a 2D grid
- Plan
  - Score left vs. right corridor
  - Choose the best corridor
- Act
  - Turn into the corridor
  - Drive safely to the goal

# Your Task

- Your robot will be placed in an unknown environment with obstacles
- Your robot must autonomously map the scene
- Then, it must drive in the direction with fewer obstructions
  - Either left or right

# Coordinate Systems

Some common coordinate systems used in robotics include cartesian coordinates and polar coordinates.

- Cartesian coordinates:  $(x, y)$ 
  - $x, y$  are distances from perpendicular axes
- Polar coordinates:  $(r, \theta)$ 
  - $r$  is the distance from the origin,  $\theta$  is the angle a ray to the point would make with the positive  $x$  axis

You will be working with both systems in pathfinder lab!

# Coordinate Systems Cont.

Recall the following formulas for converting from polar coordinates to cartesian coordinates:

## Convert Polar to Cartesian

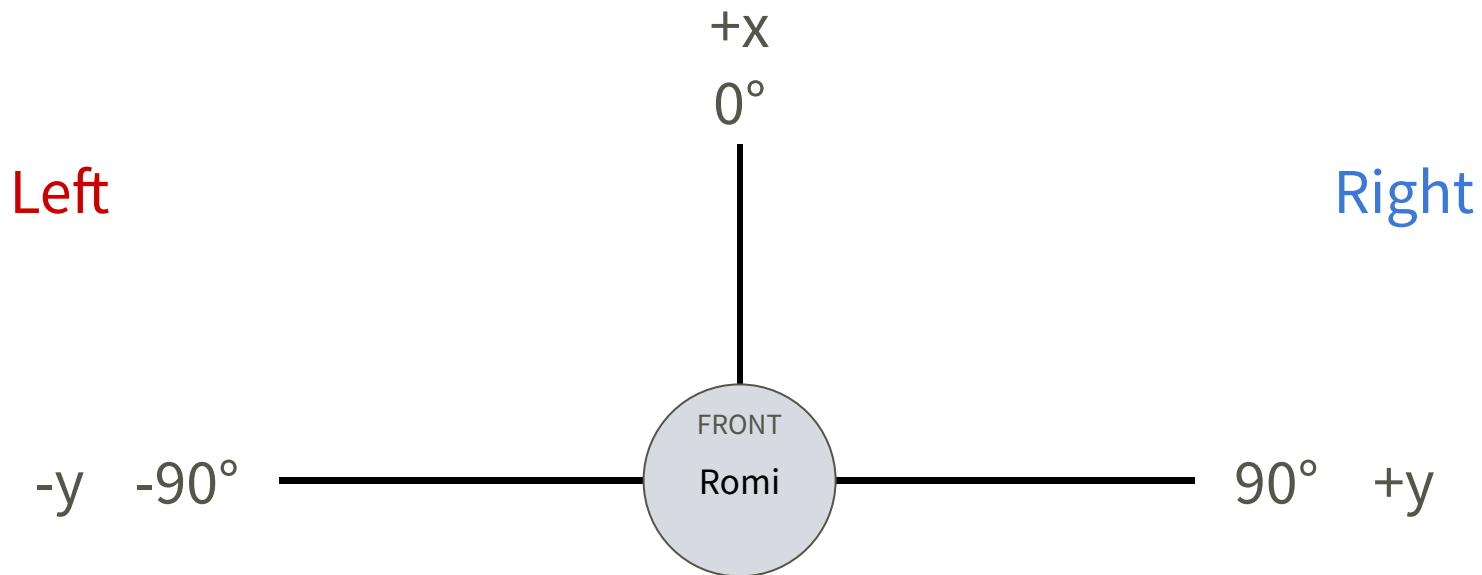

$$x = r \cos \theta$$

$$y = r \sin \theta$$

You will be converting your distance and angle into x,y coordinates to input into the occupancy grid!

# The Occupancy Grid

- In code, represented as a 2-dimensional array
  - The positive x-axis extends in front of the robot
  - The y-axis extends to the left and right
- Rotating left is a negative angle, rotating right is positive

# Occupancy Grid Cont.

----- DEPTH ----->	grid[7][0]	grid[7][1]	grid[7][2]	grid[7][3]	grid[7][4]	grid[7][5]	grid[7][6]	grid[7][7]	grid[7][8]	grid[7][9]	grid[17][10]	grid[7][11]
	grid[6][0]	grid[6][1]	grid[6][2]	grid[6][3]	grid[6][4]	grid[6][5]	grid[6][6]	grid[6][7]	grid[6][8]	grid[6][9]	grid[6][10]	grid[6][11]
	grid[5][0]	grid[5][1]	grid[5][2]	grid[5][3]	grid[5][4]	grid[5][5]	grid[5][6]	grid[5][7]	grid[5][8]	grid[5][9]	grid[5][10]	grid[5][11]
	grid[4][0]	grid[4][1]	grid[4][2]	grid[4][3]	grid[4][4]	grid[4][5]	grid[4][6]	grid[4][7]	grid[4][8]	grid[4][9]	grid[4][10]	grid[4][11]
	grid[3][0]	grid[3][1]	grid[3][2]	grid[3][3]	grid[3][4]	grid[3][5]	grid[3][6]	grid[3][7]	grid[3][8]	grid[3][9]	grid[3][10]	grid[3][11]
	grid[2][0]	grid[2][1]	grid[2][2]	grid[2][3]	grid[2][4]	grid[2][5]	grid[2][6]	grid[2][7]	grid[2][8]	grid[2][9]	grid[2][10]	grid[2][11]
	grid[1][0]	grid[1][1]	grid[1][2]	grid[1][3]	grid[1][4]	grid[1][5]	grid[1][6]	grid[1][7]	grid[1][8]	grid[1][9]	grid[1][10]	grid[1][11]
	grid[0][0]	grid[0][1]	grid[0][2]	grid[0][3]	grid[0][4]	grid[0][5]	grid[0][6]	grid[0][7]	grid[0][8]	grid[0][9]	grid[0][10]	grid[0][11]
----- WIDTH ----->												

Your robot starts here!

```
unsigned int grid[DEPTH][WIDTH]; // 0 = free, 1 = occupied
```

# Code Runthrough

1. Sweep the ultrasonic sensor from  $-90^\circ$  to  $+90^\circ$ 
  - a. At each angle, read the distance from the sensor using the provided function
  - b. Convert your (distance, angle) to (x, y)
  - c. Mark the corresponding cell in the occupancy grid
2. Choose which direction to drive in
  - a. Count up the number of occupied cells for left and right sides
  - b. The side with fewer occupied cells is the direction you drive in!

# Notes & Hints

- You may want to take multiple readings at each angle and use the average
  - Make sure to exclude any outliers! (distance  $< 5\text{cm}$  or  $> 150\text{cm}$ )
- The `grid` variable is your occupancy grid
  - We have set `DEPTH = 8` and `WIDTH = 12`
  - Since the robot starts at `WIDTH / 2`, you will need to shift your coordinates by this amount
  - Each cell is a `10cm x 10cm` block
  - The left side contains all points where  $y < \text{WIDTH} / 2$ , right side contains all points where  $y > \text{WIDTH} / 2$
- Use the `Serial.println()` function while the robot connected to your computer to print out values!
- Use the `sin()` and `cos()` functions in Arduino
  - Remember to convert to radians

# Setup
